LOCATION CODE:	425225
ADJACENT APN:	ACROSS FROM 124-25-044
SITE ADDRESS:	1691 EL CAMINO REAL PALO ALTO, 94306
COUNTY:	SANTA CLARA
SITE TYPE:	STREET LIGHT POLE
ROADWAY TYPE:	ARTERIAL & SPECIAL SETBACK FRONTAGES
HISTORIC STATUS OR DISTRICT:	N/A

PROJECT DESCRIPTION

VERIZON WIRELESS PROPOSES TO INSTALL A NEW WIRELESS COMMUNICATION SITE ON A NEW/REPLACEMENT STREET LIGHT POLE. THE SCOPE WILL CONSIST OF THE FOLLOWING:

- ☐ REMOVE (1) EXISTING STREET LIGHT/POLE #167 IN THE CA-82 PUBLIC R.O.W.
- ☐ INSTALL (1) NEW 'EL CAMINO REAL' ROADWAY LIGHT POLE W/ LED LAMP IN
- ☐ PLACE OF REMOVED LIGHT POLE #167, PER LIGHTING STYLE PLACEMENT GUIDE
- ☐ RE-CONNECT CPA STREET LIGHT POWER TO NEW/REPLACEMENT STREET LIGHT
- ☐ INSTALL NEW POLE FOUNDATION

- ☐ INSTALL (3) NEW ERICSSON SM-6701 RADIO/ANTENNAS ATOP NEW POLE
- ☐ INSTALL (1) NEW NEMA 6P AC DISCONNECT WITHIN NEW U.G. POWER HANDHOLE
- ☐ INSTALL (1) NEW 5/8"ø x10'L. GROUND ROD WITHIN NEW U.G. POWER HANDHOLE
- ☐ INSTALL NEW AC POWER CABLES FROM POC, TO DISCONNECT, TO RADIOS
- ☐ INSTALL NEW GROUND CABLES FROM DISCONNECT/RADIOS/POLE TO GROUND ROD
- ☐ INSTALL NEW FIBER CABLES FROM POC, TO DEMARC, TO RADIOS
- ☐ INSTALL NEW RF NOTICE AND EMERGENCY SHUT-DOWN SIGNAGE AS REQUIRED
- ☐ INSTALL NEW U.G. PATH FROM POWER POC TO NEW U.G. POWER HANDHOLE

** METAL SURFACES REQUIRING PAINT SHALL BE PAINTED WITH A KELLY MOORE PAINT COLOR AND CODE YET TO BE DETERMINED, BUT SHALL BE IN ACCORDANCE WITH CITY OF PALO ALTO CODE.

ADMINISTRATIVE REQUIREMENTS

SUBCONTRACTOR SHALL VERIFY ALL PLANS, EXISTING DIMENSIONS & FIELD CONDITIONS ON THE JOB SITE & SHALL IMMEDIATELY NOTIFY THE ENGINEER IN WRITING OF ANY DISCREPANCIES BEFORE PROCEEDING WITH THE WORK OR BE RESPONSIBLE FOR SAME.

Statement of Hammett & Edison, Inc., Consulting Engineers

The firm of Hammett & Edison, Inc., Consulting Engineers, has been retained on behalf of Verizon Wireless, a personal wireless telecommunications carrier, to evaluate its small cell (No. 425225 "SF Palo Alto 121") proposed to be sited in Palo Alto, California, for compliance with appropriate guidelines limiting human exposure to radio frequency ("RF") electromagnetic fields.

Executive Summary

Verizon proposes to install three small antennas on the municipal light pole sited in the public right-of-way near 1600 El Camino Real in Palo Alto. The proposed operation will comply with the FCC guidelines limiting public exposure to RF energy.

Prevailing Exposure Standards

The U.S. Congress requires that the Federal Communications Commission ("FCC") evaluate its actions for possible significant impact on the environment. A summary of the FCC's exposure limits is shown in Figure 1. These limits apply for continuous exposures and are intended to provide a prudent margin of safety for all persons, regardless of age, gender, size, or health. The most restrictive limit for exposures of unlimited duration at several wireless service bands are as follows:

Wireless Service Band	Transmit Frequency	"Uncontrolled" Public Limit	Occupational Limit (5 times Public)
Microwave (point-to-point)	1–80 GHz	1.0 mW/cm^2	5.0 mW/cm^2
Millimeter-wave	24–47	1.0	5.0
Part 15 (WiFi & other unlicensed)	2–6	1.0	5.0
CBRS (Citizens Broadband Radio)	3,550 MHz	1.0	5.0
BRS (Broadband Radio)	2,490	1.0	5.0
WCS (Wireless Communication)	2,305	1.0	5.0
AWS (Advanced Wireless)	2,110	1.0	5.0
PCS (Personal Communication)	1,930	1.0	5.0
Cellular	869	0.58	2.9
SMR (Specialized Mobile Radio)	854	0.57	2.85
700 MHz	716	0.48	2.4
600 MHz	617	0.41	2.05
[most restrictive frequency range]	30–300	0.20	1.0

General Facility Requirements

Small cells typically consist of two distinct parts: the electronic transceivers (also called "radios" or "channels") that are connected to the traditional wired telephone lines, and the passive antennas that send the wireless signals created by the radios out to be received by individual subscriber units. The radios are typically mounted on the support pole or placed in a cabinet at ground level, and they are

connected to the antennas by coaxial cables. Because of the short wavelength of the frequencies assigned by the FCC for wireless services, the antennas require line-of-sight paths for their signals to propagate well and so are installed at some height above ground. The antennas are designed to concentrate their energy toward the horizon, with very little energy wasted toward the sky or the ground. This means that it is generally not possible for exposure conditions to approach the maximum permissible exposure limits without being physically very near the antennas.

Computer Modeling Method

The FCC provides direction for determining compliance in its Office of Engineering and Technology Bulletin No. 65, "Evaluating Compliance with FCC-Specified Guidelines for Human Exposure to Radio Frequency Radiation," dated August 1997. Figure 2 describes the calculation methodologies, reflecting the facts that a directional antenna's radiation pattern is not fully formed at locations very close by (the "near-field" effect) and that at greater distances the power level from an energy source decreases with the square of the distance from it (the "inverse square law"). This methodology is an industry standard for evaluating RF exposure conditions and has been demonstrated through numerous field tests to be a conservative prediction of exposure levels.

Site and Facility Description

Based upon information provided by Verizon, it is proposed to install three 2-foot-tall Ericsson Model 6701 directional panels with integrated radios on a new light pole to replace the existing pole sited in the public right-of-way on the southwest side of El Camino Real in Palo Alto, about 200 feet northwest of its intersection with Serra Street. The antennas would be mounted around the pole at an effective height of about 32½ feet above ground and would be oriented toward 0°T, 120°T, and 240°T, together forming an omnidirectional pattern. The maximum effective radiated power proposed in any direction is 193 watts for 28 GHz service. There are reported no other wireless telecommunications base stations at the site or nearby.

Study Results

For a person anywhere at ground, the maximum RF exposure level due to the proposed Verizon operation is calculated to be 0.0037 mW/cm^2, which is 0.37% of the applicable public exposure limit. The maximum calculated level at any nearby building[*] is 0.28% of the public exposure limit. It should be noted that these results include several "worst-case" assumptions and therefore are expected to overstate actual power density levels from the proposed operation.

[*] Located at least 150 feet away, based on the drawings

Recommended Mitigation Measures

Due to their mounting location and height, the antennas would not be accessible to unauthorized persons, and so no measures are necessary to comply with the FCC public exposure guidelines. To prevent occupational exposures in excess of the FCC guidelines, it is recommended that appropriate RF safety training be provided to all workers who have access within 8 feet outward from the antennas. No access within 2 feet directly in front of the antennas should be allowed while they are in operation, unless other measures can be demonstrated to ensure that occupational protection requirements are met. It is recommended that explanatory signs[†] be posted at the antennas and/or on the pole below the antennas, readily visible from any angle of approach.

Conclusion

Based on the information and analysis above, it is the undersigned's professional opinion that operation of the small cell proposed by Verizon Wireless near 1600 El Camino Real in Palo Alto, will comply with the prevailing standards for limiting public exposure to radio frequency energy and, therefore, will not for this reason cause a significant impact on the environment. The highest calculated level in publicly accessible areas is much less than the prevailing standards allow for exposures of unlimited duration. This finding is consistent with measurements of actual exposure conditions taken at other operating small cells. Training authorized personnel and posting explanatory signs are recommended to establish compliance with FCC guidelines.

Authorship

The undersigned author of this statement is a qualified Professional Engineer, holding California Registration No. E-21306, which expires on September 30, 2021. This work has been carried out under his direction, and all statements are true and correct of his own knowledge except, where noted, when data has been supplied by others, which data he believes to be correct.

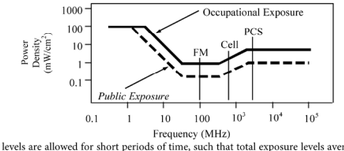
[†] Signs should comply with OET-65 color, symbol, and content recommendations. Contact information should be provided (e.g., a telephone number) to arrange for access to restricted areas. The selection of language(s) is not an engineering matter, and guidelines from the landlord, local zoning or health authority, or appropriate professionals may be required.

FCC Radio Frequency Protection Guide

The U.S. Congress required (1996 Telecom Act) the Federal Communications Commission ("FCC") to adopt a nationwide human exposure standard to ensure that its licensees do not, cumulatively, have a significant impact on the environment. The FCC adopted the limits from Report No. 86, "Biological Effects and Exposure Criteria for Radiofrequency Electromagnetic Fields," published in 1986 by the Congressionally chartered National Council on Radiation Protection and Measurements ("NCRP"). Separate limits apply for occupational and public exposure conditions, with the latter limits generally five times more restrictive. The more recent standard, developed by the Institute of Electrical and Electronics Engineers and approved as American National Standard ANSI/IEEE C95.1-2006, "Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz," includes similar limits. These limits apply for continuous exposures from all sources and are intended to provide a prudent margin of safety for all persons, regardless of age, gender, size, or health.

As shown in the table and chart below, separate limits apply for occupational and public exposure conditions, with the latter limits (in *italics* and/or dashed) up to five times more restrictive:

Frequency Applicable Range (MHz)	Electromagnetic Fields (f is frequency of emission in MHz) Electric Field Strength (V/m)		Magnetic Field Strength (A/m)		Equivalent Far-Field Power Density (mW/cm^2)	
0.3 – 1.34	614	*614*	1.63	*1.63*	100	*100*
1.34 – 3.0	614	*823.8/f*	1.63	*2.19/f*	100	*180/f^2*
3.0 – 30	1842/f	*823.8/f*	4.89/f	*2.19/f*	900/f^2	*180/f^2*
30 – 300	61.4	*27.5*	0.163	*0.0729*	1.0	*0.2*
300 – 1,500	3.54$\sqrt{f}$	*1.59$\sqrt{f}$*	$\sqrt{f}$/106	$\sqrt{f}$/*238*	f/300	*f/1500*
1,500 – 100,000	137	*61.4*	0.364	*0.163*	5.0	*1.0*



Higher levels are allowed for short periods of time, such that total exposure levels averaged over six or thirty minutes, for occupational or public settings, respectively, do not exceed the limits, and higher levels also are allowed for exposures to small areas, such that the spatially averaged levels do not exceed the limits. However, neither of these allowances is incorporated in the conservative calculation formulas in the FCC Office of Engineering and Technology Bulletin No. 65 (August 1997) for projecting field levels. Hammett & Edison has incorporated those formulas in a computer program capable of calculating, at thousands of locations on an arbitrary grid, the total expected power density from any number of individual radio frequency sources. The program allows for the inclusion of uneven terrain in the vicinity, as well as any number of nearby buildings of varying heights, to obtain more accurate projections.

RFR.CALC™ Calculation Methodology

Assessment by Calculation of Compliance with FCC Exposure Guidelines

The U.S. Congress required (1996 Telecom Act) the Federal Communications Commission ("FCC") to adopt a nationwide human exposure standard to ensure that its licensees do not, cumulatively, have a significant impact on the environment. The maximum permissible exposure limits adopted by the FCC (see Figure 1) apply for continuous exposures from all sources and are intended to provide a prudent margin of safety for all persons, regardless of age, gender, size, or health. Higher levels are allowed for short periods of time, such that total exposure levels averaged over six or thirty minutes, for occupational or public settings, respectively, do not exceed the limits.

Near Field.
Prediction methods have been developed for the near field zone of panel (directional) and whip (omnidirectional) antennas, typical at wireless telecommunications base stations, as well as dish (aperture) antennas, typically used for microwave links. The antenna patterns are not fully formed in the near field at these antennas, and the FCC Office of Engineering and Technology Bulletin No. 65 (August 1997) gives suitable formulas for calculating power density within such zones.

For a panel or whip antenna, power density $S = \frac{180}{\theta_{BW}} \times \frac{0.1 \times P_{net}}{\pi \times D \times h}$, in mW/cm^2,

and for an aperture antenna, maximum power density $S_{max} = \frac{0.1 \times 16 \times \eta \times P_{net}}{\pi \times h^2}$, in mW/cm^2,

where θ_{BW} = half-power beamwidth of antenna, in degrees,
P_{net} = net power input to antenna, in watts,
D = distance from antenna, in meters,
h = aperture height of antenna, in meters, and
η = aperture efficiency (unitless, typically 0.5-0.8).

The factor of 0.1 in the numerators converts to the desired units of power density.

Far Field.
OET-65 gives this formula for calculating power density in the far field of an individual RF source:

power density $S = \frac{2.56 \times 1.64 \times 100 \times RFF^2 \times ERP}{4 \times \pi \times D^2}$, in mW/cm^2,

where ERP = total ERP (all polarizations), in kilowatts,
RFF = three-dimensional relative field factor toward point of calculation, and
D = distance from antenna effective height to point of calculation, in meters.

The factor of 2.56 accounts for the increase in power density due to ground reflection, assuming a reflection coefficient of 1.6 (1.6 x 1.6 = 2.56). The factor of 1.64 is the gain of a half-wave dipole relative to an isotropic radiator. The factor of 100 in the numerator converts to the desired units of power density. This formula is used in a computer program capable of calculating, at thousands of locations on an arbitrary grid, the total expected power density from any number of individual radio frequency sources. The program also allows for the inclusion of uneven terrain in the vicinity, as well as any number of nearby buildings of varying heights, to obtain more accurate projections.

SHEET TITLE
LOCATION MAP

SHEET NUMBER
A-1.3

- ALL WORK SHALL COMPLY WITH THE CITY OF PALO ALTO 2018 STANDARD DRAWINGS AND SPECIFICATIONS BORING, TRENCHING, POTHOLING AND DEWATERING, SECTION 17
- THE LOCATION OF EXISTING UTILITY MAINS AND LATERAL LINES INCLUDING STORM DRAIN, SANITARY SEWER, WATER, GAS, UNDERGROUND ELECTRICAL AND COMMUNICATION CONDUITS CROSSING THE TRENCH EXCAVATION SHALL BE VERIFIED BY THE CONTRACTOR. THE CONTRACTOR SHALL BE RESPONSIBLE FOR NOTIFYING UNDERGROUND SERVICES ALERT (USA) AT 811 OR 800-642-2444 AT LEAST FIVE (5) WORKING DAYS PRIOR TO BEGINNING UNDERGROUND WORK SO THAT EXISTING UTILITIES CAN BE MARKED IN THE FIELD, UNLESS OTHERWISE STATED BY CITY CONTRACT.
- EXCAVATION SHALL BE SUPPORTED AND EXCAVATION OPERATIONS CONDUCTED IN ACCORDANCE WITH THE RULES OF THE CALIFORNIA OCCUPATIONAL SAFETY & HEALTH ADMINISTRATION (OSHA). IF IN THE OPINION OF THE ENGINEER, THERE EXISTS A SITUATION OF IMMINENT DANGER TO THE WORKERS, THE ENGINEER MAY ORDER THE WORK STOPPED AND THE CONTRACTOR SHALL COMPLY WITH RULES OF THE CALIFORNIA OCCUPATIONAL SAFETY & HEALTH ADMINISTRATION (OSHA).
- BACKFILL SHALL BE SAND OR GRANULAR MATERIAL FALLING WITHIN THE LIMITS DESCRIBED IN THE STANDARD DRAWING 401. AGGREGATE BASE, ASPHALT CONCRETE, PORTLAND CEMENT CONCRETE SHALL CONFORM TO THE REQUIREMENTS WITHIN THESE SPECIFICATIONS.
- THE CONTRACTOR SHALL INSTALL THE CONDUIT IN ACCORDANCE WITH THE APPROVED STREET WORK PERMIT. ALL CONDUITS SHALL BE INSTALLED UNDERGROUND USING DIRECTIONAL BORING METHOD. MICRO-TUNNELING OR OTHER METHODS SHALL BE APPROVED BY THE PUBLIC WORKS ENGINEERING DIVISION. THE CONDUITS SHALL BE INSTALLED WITH TRACER WIRE APPROVED BY THE ENGINEER PER CITY OF PALO ALTO UTILITIES DEPARTMENT WATER, GAS AND WASTEWATER UTILITY STANDARDS. REFER TO STANDARD DRAWING 402.
- TRENCHES SHALL NOT BE LEFT OPEN AT THE END OF THE DAY. ADEQUATE PROVISIONS SHALL BE MADE FOR THE PLACING OF TEMPORARY STEEL PLATES IN ADDITION TO BARRICADES, SIGNING AND LIGHTING. STOCKPILING OF EXCAVATED MATERIAL WITHIN THE PUBLIC RIGHT-OF-WAY SHALL NOT BE ALLOWED. A MAXIMUM OF THREE-HUNDRED (300) FEET OR ONE (1) CITY BLOCK OF TRENCH, WHICHEVER IS GREATER, MAY BE OPENED AT ONE TIME. FOR TEMPORARY PATCHING, A MINIMUM THICKNESS OF TWO (2) INCHES OF CUTBACK WILL BE USED.
- PRIOR TO EXCAVATION OF TRENCHING, POTHOLING OR SENDING/RECEIVING PITS, THE ASPHALT CONCRETE OR PORTLAND CEMENT CONCRETE SHALL BE CUT OR MILL TO A NEAT LINE FULL DEPTH WITH A SAW-CUTTING OR MILLING DEVICE APPROVED BY THE ENGINEER.
- BACKFILL MATERIAL SHALL BE COMPACTED TO 90 PERCENT MINIMUM RELATIVE COMPACTION EXCEPT THE TOP TWENTY-FOUR (24) INCHES, WHICH SHALL BE MECHANICALLY COMPACTED TO 95 PERCENT MINIMUM RELATIVE COMPACTION. MECHANICALLY COMPACTED LIFTS USING ALTERNATIVE EQUIPMENT, COMPLYING WITH MANUFACTURE'S SPECIFICATION, WILL REQUIRE THE APPROVAL OF THE ENGINEER. USE OF ALTERNATIVE COMPACTION EQUIPMENT SHALL NOT RELIEVE THE CONTRACTOR FROM RESPONSIBILITY FOR ANY DAMAGE TO THE CONDUIT, SURROUNDING GROUND, OR EXISTING AND NEW IMPROVEMENTS.

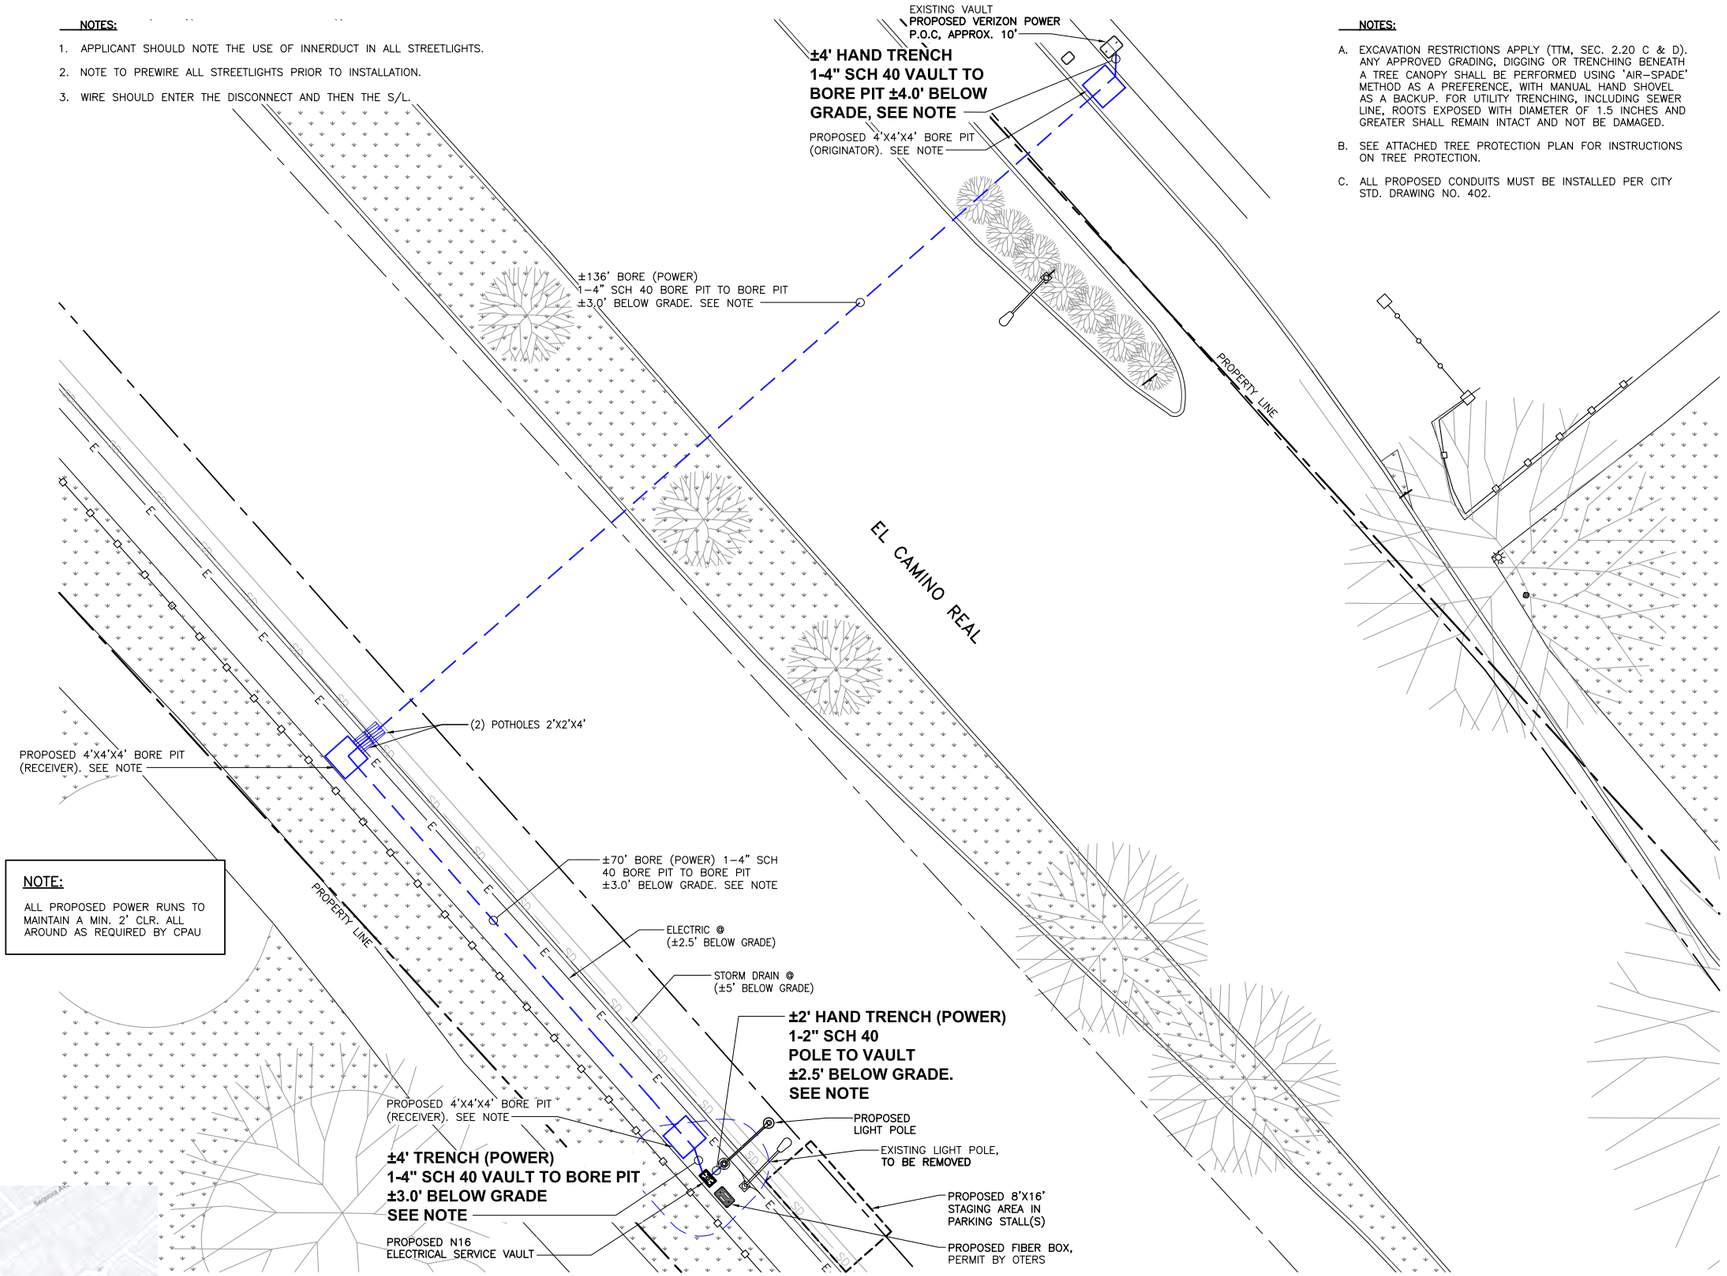
② NOTES

Sawcutting & Asphalt/Concrete Removal

- ☐ Protect storm drain inlets during saw cutting.
- ☐ If saw cut slurry enters a catch basin, clean it up immediately.
- ☐ Shovel or vacuum saw cut slurry deposits and remove from the site. When making saw cuts, use as little water as possible. Sweep up, and properly dispose of all residues.

NOTES:

1. APPLICANT SHOULD NOTE THE USE OF INNERDUCT IN ALL STREETLIGHTS.
2. NOTE TO PREWIRE ALL STREETLIGHTS PRIOR TO INSTALLATION.
3. WIRE SHOULD ENTER THE DISCONNECT AND THEN THE S/L.



NOTE:

ALL PROPOSED POWER RUNS TO MAINTAIN A MIN. 2' CLR. ALL AROUND AS REQUIRED BY CPAU

NOTES:

A. EXCAVATION RESTRICTIONS APPLY (TTM, SEC. 2.20 C & D). ANY APPROVED GRADING, DIGGING OR TRENCHING BENEATH A TREE CANOPY SHALL BE PERFORMED USING 'AIR-SPADE' METHOD AS A PREFERENCE, WITH MANUAL HAND SHOVEL AS A BACKUP. FOR UTILITY TRENCHING, INCLUDING SEWER LINE, ROOTS EXPOSED WITH DIAMETER OF 1.5 INCHES AND GREATER SHALL REMAIN INTACT AND NOT BE DAMAGED.

B. SEE ATTACHED TREE PROTECTION PLAN FOR INSTRUCTIONS ON TREE PROTECTION.

C. ALL PROPOSED CONDUITS MUST BE INSTALLED PER CITY STD. DRAWING NO. 402.

CITY STANDARDS & DETAILS

SHEET NUMBER
A-1.5

- Grade fills over 6-inches or impervious overlay shall incorporate an approved permanent aeration system, permeable material or other approved mitigation.
- Grade cuts exceeding 4-inches shall incorporate retaining walls or an appropriate transition equivalent.

notes:

Required Practices

C. Trenching, Excavation and Equipment Use

Trenching, excavation or boring activity within the TPZ is restricted to the following activities, conditions and requirements if approved by the *City Arborist*. *(See Restriction Zones for Excavation, Trenching or Boring Near Regulated Trees, Image 2.20-1 through 2.20-3)*. Mitigating measures shall include prior notification to and direct supervision by the *project arborist*.

1. Notification. Contractor shall notify the *project arborist* a minimum of 24 hours in advance of the activity in the TPZ.
2. Root Severance. Roots that are encountered shall be cut to sound wood and repaired (*see Root Injury, Section 2.25 A-1*). Roots 2-inches and greater must remain injury free.
3. Excavation. Any approved excavation, demolition or extraction of material shall be performed with equipment sitting outside the TPZ. Methods permitted are by hand digging, hydraulic or pneumatic air excavation technology. Avoid excavation within the TPZ during hot, dry weather.
   - If excavation or *trenching* for drainage, utilities, irrigation lines, etc., it is the duty of the contractor to tunnel under any roots 2-inches in diameter and greater.
   - Prior to excavation for foundation/footings/walls, grading or *trenching* within the TPZ, roots shall first be severed cleanly 1-foot outside the TPZ and to the depth of the future excavation. The trench must then be hand dug and roots pruned with a saw, sawzall, narrow trencher with sharp blades or other approved root pruning equipment.
4. Heavy Equipment. Use of backhoes, steel tread tractors or any heavy vehicles within the TPZ is prohibited unless approved by the *City Arborist*. If allowed, a protective *root buffer* (*see Root Buffer and Damage to Trees, Section 2.25.A-1*) is required. The protective buffer shall consist of a base course of tree chips spread over the root area to a minimum of 6-inch depth, layered by 3/4-inch quarry gravel to stabilize 3/4-inch plywood on top. This buffer within the TPZ shall be maintained throughout the entire construction process.
   - Structural design. If injurious activity or interference with roots greater than 2-inches will occur within the TPZ, plans shall specify a design of special foundation, footing, walls, concrete slab or pavement designs subject to *City Arborist* approval. Discontinuous foundations such as concrete pier and structural grade beam must maintain natural grade (not to exceed a 4-inch cut), to minimize root loss and allow the tree to use the existing soil.

- Basement excavations shall be designed outside the TPZ of all *protected* and *designated trees* (*see Excavation, Section 2.20-3*) and shall not be harmful to other mature or neighboring property trees.

notes:

Required Practices

D. Tunneling & Directional Drilling

If *trenching* or pipe installation has been approved within the TPZ, then the trench shall be either cut by hand, air-spade, hydraulic vac-on excavation or, by mechanically boring the tunnel under the roots with a horizontal directional drill and hydraulic or pneumatic air excavation technology. In all cases, install the utility pipe immediately, backfill with soil and soak within the same day. Installation of private utility improvements shall be tunnel bored beneath the tree and roots per *Trenching Tunneling & Distance Matrix* In Table 2-1.

TABLE 2-1
Trenching & Tunneling Distance

TRENCHING DISTANCE

When the Tree Diameter At 4.5 Ft Is:	Trenching will be Replaced with Boring at this Minimum Distance (10x tree dia.) from the Face of the Tree in any Direction:
6-9" Measured At 6" à	6-9'
10-14" Measured At 54" à	10-14'
15-19" Measured At 54" à	15-19'
Over 19" Measured At 54" à	20' +

DEPTH OF TUNNELING

Tree Diameter	Depth of Tunneling
9" Or Less Measured At 6" à	2.5'
10-14" Measured At 54" à	3.0'
15-19" Measured At 54" à	3.5'
More Than 19" Measured At 54" Depth of Tunnel à	4.0'

Bore Pits Shall Be Located At A Minimum Distance As Specified By The Trenching Distance Table Above.

1. Public Utilities
   Underground public utility improvements or repairs shall be performed in accordance with the *Utility Standards for Excavation, Trenching or Boring, Section 02200.309*; and per *Restriction Zones Near Regulated Trees (see Images 2.20-1 through 2.20-3)*.
2. Street Trees
   Exclusions for *street trees* in the publicly owned right-of-way (ROW).
   - *Street Trees* that are in conflict with utility infrastructure where the conflict cannot be resolved may be removed if approved by Public Works Operations (e.g., a tree planted directly on top of a damaged sewer lateral.)

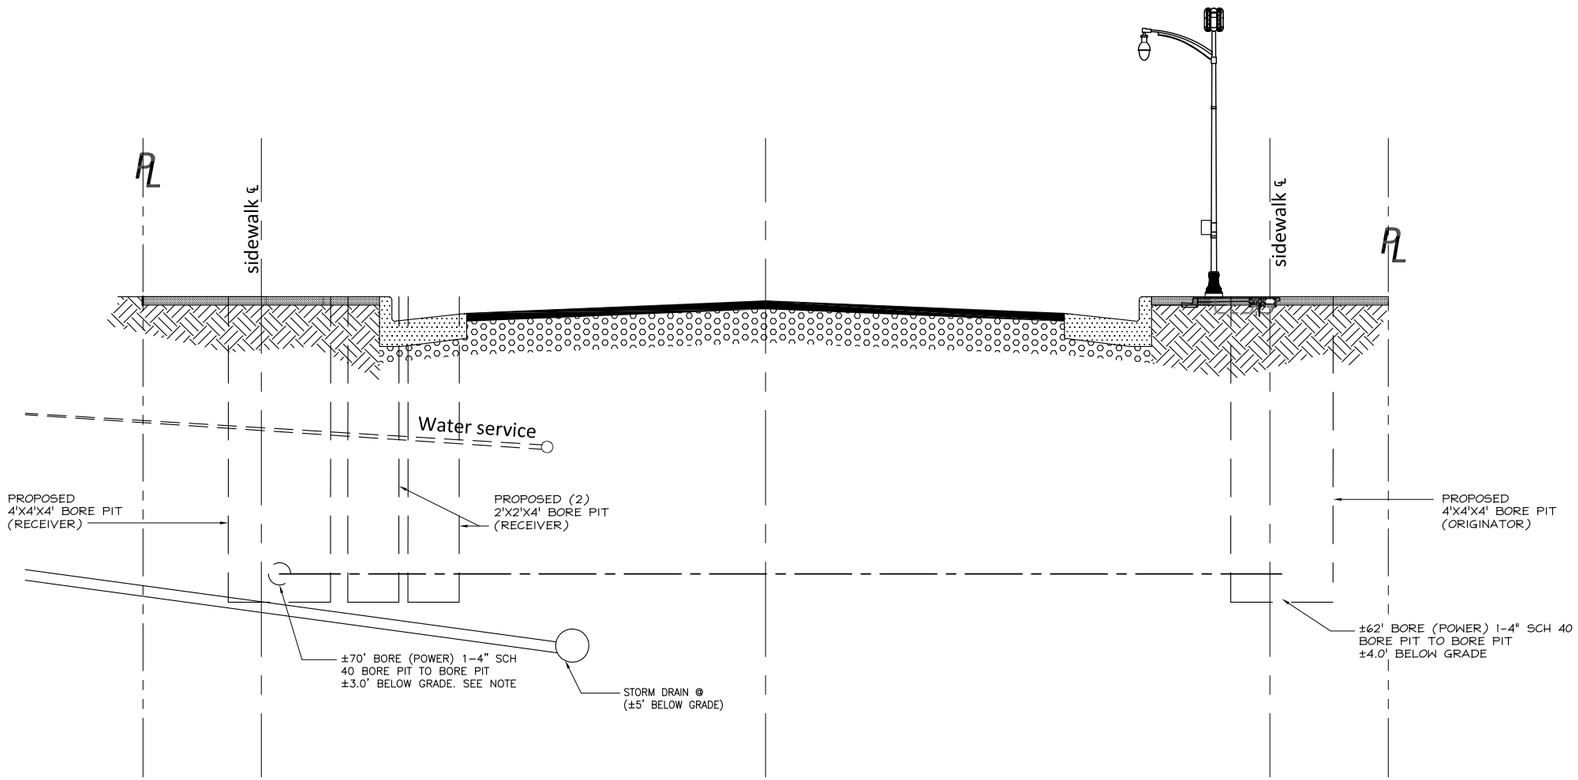
6. TRENCHES SHALL NOT BE LEFT OPEN AT THE END OF THE DAY. ADEQUATE PROVISIONS SHALL BE MADE FOR THE PLACING OF TEMPORARY STEEL PLATES IN ADDITION TO BARRICADES, SIGNING AND LIGHTING. STOCKPILING OF EXCAVATED MATERIAL WITHIN THE PUBLIC RIGHT-OF-WAY SHALL NOT BE ALLOWED. A MAXIMUM OF THREE-HUNDRED (300) FEET OR ONE (1) CITY BLOCK OF TRENCH, WHICHEVER IS GREATER, MAY BE OPENED AT ONE TIME. FOR TEMPORARY PATCHING, A MINIMUM THICKNESS OF TWO (2) INCHES OF CUTBACK WILL BE USED.
7. PRIOR TO EXCAVATION OF TRENCHING, POTHOLING OR SENDING/RECEIVING PITS, THE ASPHALT CONCRETE OR PORTLAND CEMENT CONCRETE SHALL BE CUT OR MILL TO A NEAT LINE FULL DEPTH WITH A SAW-CUTTING OR MILLING DEVICE APPROVED BY THE ENGINEER.
8. BACKFILL MATERIAL SHALL BE COMPACTED TO 90 PERCENT MINIMUM RELATIVE COMPACTION EXCEPT THE TOP TWENTY-FOUR (24) INCHES, WHICH SHALL BE MECHANICALLY COMPACTED TO 95 PERCENT MINIMUM RELATIVE COMPACTION. MECHANICALLY COMPACTED LIFTS USING ALTERNATIVE EQUIPMENT, COMPLYING WITH MANUFACTURE'S SPECIFICATION, WILL REQUIRE THE APPROVAL OF THE ENGINEER. USE OF ALTERNATIVE COMPACTION EQUIPMENT SHALL NOT RELIEVE THE CONTRACTOR FROM RESPONSIBILITY FOR ANY DAMAGE TO THE CONDUIT, SURROUNDING GROUND, OR EXISTING AND NEW IMPROVEMENTS.

(2) NOTES



(1) R.O.W SECTION
NTS

Sawcutting & Asphalt/Concrete Removal

- ☐ Protect storm drain inlets during saw cutting.
- ☐ If saw cut slurry enters a catch basin, clean it up immediately.
- ☐ Shovel or vacuum saw cut slurry deposits and remove from the site. When making saw cuts, use as little water as possible. Sweep up, and properly dispose of all residues.

Verizon Wireless • Proposed Small Cells
Three Pole Locations • Palo Alto, California

Statement of Hammett & Edison, Inc., Consulting Engineers

The firm of Hammett & Edison, Inc., Consulting Engineers, has been retained on behalf of Verizon Wireless, a wireless telecommunications carrier, to evaluate three small cells proposed to be sited in Palo Alto, California, for compliance with municipal limits on sound levels from the installations.

Executive Summary

Verizon proposes to install antennas and equipment on three light poles sited in the public right-of-way in Palo Alto. Noise from the proposed operations will comply with the City's pertinent noise limits.

Prevailing Standard

Palo Alto adopted Resolution No. 9825 (April 15, 2019) "Resolution of the Council of the City of Palo Alto Adopting Objective Aesthetic, Noise, and Related Standards for Wireless Communication Facilities in the Public Rights of Way," which sets limits on noise at residential areas for wireless facilities installed in public rights-of-way. Noise at the nearest residential property line is limited to an increase of 5 dB over existing ambient levels, if the ambient noise level would remain below 60 dBA L_{dn}, or to an increase of 3 dB, otherwise. The composite "day-night" average L_{dn} incorporates a 10 dB penalty during nighttime hours (10 pm to 7 am), to reflect typical residential conditions, where noise is more readily heard at night. By definition, sound from a continuous noise source will be 6.4 dB higher when expressed in L_{dn}.

It is noted that the amended language also references Chapter 9.10 of the Code, which had set a more relaxed increase of 15 dB increase for such WCF sitings, assessed at 25 feet from the pole. It is assumed for this study that the minimum reference ambient level is 40 dBA, as defined in Chapter 9.10.

A summary of noise assessment and calculation methodologies is shown in Figure 1.

General Facility Requirements

Small cells typically consist of two distinct parts: the electronic transceivers (also called "radios"), that are connected to traditional wired telephone lines, and the antennas that send wireless signals created by the radios out to be received by individual subscriber units. The radios are typically mounted on the support pole or placed in a cabinet at the base of the pole, and are connected to the antennas by cables. Some radios require fans to cool the electronics inside. Some radios are integrated with the antennas as a single unit.

Verizon Wireless • Proposed Small Cells
Three Pole Locations • Palo Alto, California

Site & Facility Description

According to information provided by Verizon, that carrier proposes to install a cylindrical antenna and two Ericsson Model 4402 radio units within a shroud on top of the light pole in the public right-of-way at each of the three locations listed in Table 1, and three Ericsson Model 6701 antennas, with integrated radios, within shrouds below the light arm on the pole.

Study Results

Ericsson reports that the maximum noise level from any one Model 4402 radio is 40.9 dBA,* and that the maximum noise level from three Model 6701 units is 39.6 dBA,* both at a reference distance of 5 feet. The cylindrical antenna is passively cooled, generating no noise.

At a distance of 6¼ feet, the calculated noise level from the simultaneous operation of this combined equipment would result in an increase not exceeding 5 dB above the minimum allowed ambient level of 40 dBA; the increase above the ambient would be less than 5 dB for any siting of the equipment beyond this distance. If the existing ambient were determined to be above 40 dBA statutory minimum, then the calculated increase due to the Verizon operation would, by definition, decrease. **All of the proposed small cells in Table 1 meet this distance requirement.**

Conclusion

Based on the information and analysis above, it is the undersigned's professional opinion that operation of these Verizon Wireless small cells proposed in Palo Alto will, under the conditions noted above, comply with the municipal standards limiting acoustic noise emission levels.

Authorship

The undersigned author of this statement is a qualified Professional Engineer, holding California Registration Nos. E-13026 and M-20676, which expire on June 30, 2021. This work has been carried out under his direction, and all statements are true and correct of his own knowledge except, where noted, when data has been supplied by others, which data he believes to be correct.

REGISTERED PROFESSIONAL ENGINEER WILLIAM F. HAMMETT E-13026 M-20676 Exp. 6-30-2021 ELECTRICAL MECHANICAL STATE OF CALIFORNIA

Noise Level Calculation Methodology

Most municipalities and other agencies specify noise limits in units of dBA, which is intended to mimic the reduced receptivity of the human ear to Sound Pressure ("L_P") at particularly low or high frequencies. This frequency-sensitive filter shape, shown in the graph to the right as defined in the International Electrotechnical Commission Standard No. 179, the American National Standards Institute Standard No. 5.1, and various other standards, is also incorporated into most calibrated field test equipment for measuring noise levels.

50 dBA	office space
60 dBA	conversation
70 dBA	car radio
80 dBA	traffic corner
90 dBA	lawnmower

The dBA units of measure are referenced to a pressure of 20 μPa (micropascals), which is the threshold of normal hearing. Although noise levels vary greatly by location and noise source, representative levels are shown in the box to the left.

Manufacturers of many types of equipment, such as air conditioners, generators, and telecommunications devices, often test their products in various configurations to determine the acoustical emissions at certain distances. This data, normally expressed in dBA at a known reference distance, can be used to determine the corresponding sound pressure level at any particular distance, such as at a nearby building or property line. The sound pressure drops as the square of the increase in distance, according to the formula:

$$L_P = L_K + 20 \log(D_K/D_P),$$

where L_P is the sound pressure level at distance D_P and L_K is the known sound pressure level at distance D_K.

Individual sound pressure levels at a particular point from several different noise sources cannot be combined directly in units of dBA. Rather, the units need to be converted to scalar sound intensity units in order to be added together, then converted back to decibel units, according to the formula:

$$L_T = 10 \log \left(10^{L_1/10} + 10^{L_2/10} + \ldots\right),$$

where L_T is the total sound pressure level and L_1, L_2, etc are individual sound pressure levels.

Certain equipment installations may include the placement of barriers and/or absorptive materials to reduce transmission of noise beyond the site. Noise Reduction Coefficients ("NRC") are published for many different materials, expressed as unitless power factors, with 0 being perfect reflection and 1 being perfect absorption. Unpainted concrete block, for instance, can have an NRC as high as 0.35. However, a barrier's effectiveness depends on its specific configuration, as well as the materials used and their surface treatment.

Qty	3	Bracket	AC8-1A-R5-CAP1-SCRAL7022TX

Description of Components:

Arm: Shall be made from spun and tapered aluminum 6063-T4, tempered to T6 after welding. The tapered arm is formed into a vertically oriented ellipse of 4" (102mm) by 2 7/8" (73mm) welded onto a plate and mechanically assembled to central adaptor. The bracket end is of 2 3/8" (60mm) O.D.

Decorative Element: Flat made of bent aluminum, 2" (51mm) wide, 0.375" (10mm) thick, mechanically assembled.

Central Adaptor: Made of cast 356 aluminum, complete with a top decorative cap. Slip-fits 9" (229mm) over a 4" (102mm) outside diameter pole or tenon. Mechanically fastened to the pole or tenon.

Bracket Options: (CAP1),Optional Pole Cap

Note: The AC8 bracket meets the AASHTO 2001 standard specifications for structural support for luminaires.

Bracket Properties (Weight and EPA): 32 lbs (14.5 kg), 3.87 ft²

Qty 1 Luminaire **RNS20-55W32LED4K-T-ACDR-LE3-120-DMG-SMB-RC-BKTX**

Description of Components:

Hood: Cast 356.1 aluminum dome, mechanically assembled on the housing, c/w a watertight grommet, mechanically assembled to the bracket with four bolts 3/8-16 UNC. This suspension system permits for a full rotation of the luminaire in 90 degree increments.

Housing: In a round shape, this housing is made of 356.1 aluminum, complete with a weatherproof door giving a tool-free access to the ballast, mechanically assembled. This suspension system permits for a full rotation of the luminaire in 90 degree increments.

Access-Mechanism: A gravity die cast 356 aluminum frame with latch and hinge. The mechanism shall offer tool-free access to the inside of the luminaire. An embedded memory-retentive gasket shall ensure weatherproofing.

Light Engine: LEDgine composed of 4 main components: **Heat Sink / LED Module / Optical System / Driver**
Electrical components are RoHS compliant.

Heat Sink: Made of cast aluminum optimising the LEDs efficiency and life. Product does not use any cooling device with moving parts (only passive cooling device).

Globe: (ACDR), Made of one-piece seamless injection-molded impact-resistant (DR) acrylic having an inner prismatic surface. Complete with a semi-prismatic house side shield and external glare softening prisms. The globe is mechanically assembled and sealed onto the lower part of the heat sink.

LED Module: LED type Philips Lumileds LUXEON T. Composed of 32 high-performance white LEDs. Color temperature as per ANSI/NEMA bin Neutral White, 4000 Kelvin nominal (3985K +/- 275K or 3710K to 4260K), CRI 70 Min. 75 Typical.

RNS20 (Reference=L23638-3)

Optical System: (LE3), IES type III (asymmetrical). Composed of high-performance optical grade PMMA acrylic refractor lenses to achieve desired distribution optimized to get maximum spacing, target lumens and a superior lighting uniformity. Optical system is rated IP66. Performance shall be tested per LM-63, LM-79 and TM-15 (IESNA) certifying its photometric performance. Street side indicated.

Driver: High power factor of 90% minimum. Electronic driver, operating range 50/60 Hz. **Auto-adjusting universal voltage input from 120 to 277 VAC rated for both application line to line or line to neutral, Class I**, THD of 20% max. Maximum ambient operating temperature from -40F(-40C) to 130F(55C) degrees. **Driver comes with dimming compatible 0-10 volts.**

The current supplying the LEDs will be reduced by the driver if the driver experiences internal overheating as a protection to the LEDs and the electrical components. Output is protected from short circuits, voltage overload and current overload. Automatic recovery after correction. Standard built-in driver surge protection of 2.5kV (min).

Driver Options: (DMG), Dimming compatible 0-10 volts. For applicable warranty, certification and operation guide see *"Philips Lumec dimmable luminaire specification document for unapproved device installed by other"*. To get document, click on this link: Specification document or go on web site on this address: http://www.lumec.com/Lumec3DV2/PdfWebLink/Philips Lumec dimmable luminaire specification document for unapproved device installed by other.pdf

Surge Protector: Surge protector tested in accordance with ANSI/IEEE C62.45 per ANSI/IEEE C62.41.2 Scenario I Category C High Exposure 10kV/10kA waveforms for Line-Ground, Line-Neutral and Neutral-Ground, and in accordance with U.S. DOE (Department of Energy) MSSLC (Municipal Solid-State Street Lighting Consortium) model specification for LED roadway luminaires electrical immunity requirements for High Test Level 10kV / 10kA.

Adaptor: (SMB), Made of cast 356 aluminum, complete with a block connector, mechanically assembled to the bracket. Can be mounted on a 1.66"(42mm) to 2.38"(60mm) outside diameter bracket arm tubing that slip fits 6.5" (165mm) long inside the adaptor, permits an adjustment of ± 5°.

Luminaire Options: (RC), Receptacle for a twist-lock photoelectric cell or a shorting cap. Use of photocell or shorting cap is required to ensure proper illumination.

RNS20 (Reference=L23638-3)

Miscellaneous

Description of Components:

Wiring: Gauge (#14) TEW/AWM 1015 or 1230 wires, 6" (152mm) minimum exceeding from luminaire.

Hardware: All exposed screws shall be complete with Ceramic primer-seal basecoat to reduce seizing of the parts and offers a high resistance to corrosion. All seals and sealing devices are made and/or lined with EPDM and/or silicone and/or rubber.

Finish: Color to be **black textured RAL9005TX (BKTX)** and in accordance with the AAMA 2603 standard. Application of polyester powder coat paint (4 mils/100 microns) with ± 1 mils/24 microns of tolerance. The Thermosetting resins provides a discoloration resistant finish in accordance with the ASTM D2244 standard, as well as luster retention in keeping with the ASTM D523 standard and humidity proof in accordance with the ASTM D2247 standard.

The surface treatment achieves a minimum of 2000 hours for salt spray resistant finish in accordance with testing performed and per ASTM B117 standard.

LED products manufacturing standard: The electronic components sensitive to electrostatic discharge (ESD) such as light emitting diodes (LEDs) are assembled in compliance with IEC61340-5-1 and ANSI/ESD S20.20 standards so as to eliminate ESD events that could decrease the useful life of the product.

Quality Control: The manufacturer must provide a written confirmation of its ISO 9001-2008 and ISO 14001-2004 International Quality Standards Certification.

Certification: The manufacturer will have to supply a copy of approval products certificate, CSA or UL.

Vibration Resistance: The RNS20 meets the **ANSI C136.31-2001**, American National Standard for Roadway Luminaire Vibration specifications for normal applications. (Tested for 1.5G over 100 000 cycles)

ALLSTATES

Project Description:
All States Engineering & Surveying (ASES) is pleased to submit this **"Structural Analysis Report"** to determine the structural integrity of the metal pole.
The purpose of the analysis is to determine acceptability of the pole stress level. Based on our analysis we have determined the metal pole stress level for the structure and anchorage, under the following load case:

LC: Proposed Pole + Proposed Equipment with Shroud
(Please see page 5 for details)

All modifications and equipment proposed in this report shall be installed in accordance with the attached drawings for the determined available structural capacity to be effective.

Structural Analysis Parameters:
This analysis has been performed in accordance with AASHTO 2013 guidelines.

- Wind Speed: ***85 mph per AASHTO 2013***
- Exposure Category: ***C***
- Risk Category: ***II***
- Topographical: ***1***
- Crest Height = ***0***
- Ice Thickness = ***0 in***
- Min. Soil Lateral Bearing = ***100 psf/ft*2 = 200 psf/ft per CBC & IBC 1806.3.4***
- Min. Soil Bearing = ***1500 psf***

We at *All States Engineering & Surveying* appreciate the opportunity of providing our continuing professional services to you. If you have any questions or need further assistance on this or any other projects, please give us a call.

ATC Hazards by Location

Address:	1664 El Camino Real, Palo Alto, CA 94306, USA
Coordinates:	37.430475, -122.1524438
Elevation:	49 ft
Timestamp:	2020-12-04T19:10:34.720Z
Hazard Type:	Seismic
Reference Document:	ASCE7-16
Risk Category:	II
Site Class:	D-default

Basic Parameters

Name	Value	Description
S_S	1.775	MCE_R ground motion (period=0.2s)
S_1	0.637	MCE_R ground motion (period=1.0s)
S_{MS}	2.13	Site-modified spectral acceleration value
S_{M1}	* null	Site-modified spectral acceleration value
S_{DS}	1.42	Numeric seismic design value at 0.2s SA
S_{D1}	* null	Numeric seismic design value at 1.0s SA

* See Section 11.4.8

Additional Information

Name	Value	Description
SDC	* null	Seismic design category
F_a	1.2	Site amplification factor at 0.2s
F_v	* null	Site amplification factor at 1.0s
CR_S	0.915	Coefficient of risk (0.2s)
CR_1	0.9	Coefficient of risk (1.0s)
PGA	0.73	MCE_G peak ground acceleration
F_{PGA}	1.2	Site amplification factor at PGA
PGA_M	0.877	Site modified peak ground acceleration

T_L	12	Long-period transition period (s)
SsRT	2.057	Probabilistic risk-targeted ground motion (0.2s)
SsUH	2.248	Factored uniform-hazard spectral acceleration (2% probability of exceedance in 50 years)
SsD	1.775	Factored deterministic acceleration value (0.2s)
S1RT	0.82	Probabilistic risk-targeted ground motion (1.0s)
S1UH	0.912	Factored uniform-hazard spectral acceleration (2% probability of exceedance in 50 years)
S1D	0.637	Factored deterministic acceleration value (1.0s)
PGAd	0.73	Factored deterministic acceleration value (PGA)

* See Section 11.4.8

Tower Input Data

The tower is a monopole.
This tower is designed using the ASSHTO 2013 standard. The following design criteria apply:

- Tower is located in Santa Clara County, California.
- Basic wind speed of 85 mph.
- Structure Class II.
- Exposure Category C.
- Topographic Category 1.
- Crest Height 0.00 ft.
- Deflections calculated using a wind speed of 60 mph.
- A non-linear (P-delta) analysis was used.
- Pressures are calculated at each section.
- Stress ratio used in pole design is 1.
- Local bending stresses due to climbing loads, feed line supports, and appurtenance mounts are not considered.

Specifier's comments:

1 Input data

Anchor type and diameter:	Heavy Hex Head ASTM F 1554 GR. 36 1
Item number:	not available
Effective embedment depth:	h_{ef} = 25.000 in.
Material:	ASTM F 1554
Evaluation Service Report:	Hilti Technical Data
Issued I Valid:	- | -
Proof:	Design Method ACI 318-08 / CIP
Stand-off installation:	without clamping (anchor); restraint level (anchor plate): 1.00; e_b = 1.250 in.; t = 0.500 in.
Anchor plate[1]:	l, x l, x t = 13.000 in. x 13.000 in. x 0.500 in.; (Recommended plate thickness: not calculated)
Profile:	Round HSS (AISC); HSS10X.188; (L x W x T) = 10.000 in. x 10.000 in. x 0.188 in.
Base material:	cracked concrete, 3000, f'c = 3,000 psi; h = 84.000 in.
Reinforcement:	tension: condition A, shear: condition B; anchor reinforcement: tension edge reinforcement: > No. 4 bar with stirrups
Seismic loads (cat. C, D, E, or F)	no

[1] - The anchor calculation is based on a rigid anchor plate assumption.

Geometry [in.] & Loading [lb, ft-lb]

4 Remarks; Your Cooperation Duties

- Any and all information and data contained in the Software concern solely the use of Hilti products and are based on the principles, formulas and security regulations in accordance with Hilti's technical directions and operating, mounting and assembly instructions, etc., that must be strictly complied with by the user. All figures contained therein are average figures, and therefore use-specific tests are to be conducted prior to using the relevant Hilti product. The results of the calculations carried out by means of the Software are based essentially on the data you put in. Therefore, you bear the sole responsibility for the absence of errors, the completeness and the relevance of the data to be put in by you. Moreover, you bear sole responsibility for having the results of the calculation checked and cleared by an expert, particularly with regard to compliance with applicable norms and permits, prior to using them for your specific facility. The Software serves only as an aid to interpret norms and permits without any guarantee as to the absence of errors, the correctness and the relevance of the results or suitability for a specific application.
- You must take all necessary and reasonable steps to prevent or limit damage caused by the Software. In particular, you must arrange for the regular backup of programs and data and, if applicable, carry out the updates of the Software offered by Hilti on a regular basis. If you do not use the Auto Update function of the Software, you must ensure that you are using the current and thus up-to-date version of the Software in each case by carrying out manual updates via the Hilti Website. Hilti will not be liable for consequences, such as the recovery of lost or damaged data or programs, arising from a culpable breach of duty by you.

Pole Footing Embedded in Soil

DESCRIPTION: Proposed Caisson embedment (soil values From IBC Table 1806.2 with lateral bearing load increase from IBC 1806.3.4)

Code References

Calculations per IBC 2018 1807.3, CBC 2019, ASCE 7-16
Load Combinations Used : ASCE 7-16

General Information

Pole Footing Shape: Circular
Pole Footing Diameter: 36.0 in
Calculate Min. Depth for Allowable Pressures
No Lateral Restraint at Ground Surface
Allow Passive: 200.0 pcf
Max Passive: 1,500.0 psf

Controlling Values

Governing Load Combination : +D+W
Lateral Load: 0.9770 k
Moment: 15.728 k-ft
NO Ground Surface Restraint
Pressures at 1/3 Depth
Actual: 433.356 psf
Allowable: 433.550 psf

Minimum Required Depth: 6.625 ft

Footing Base Area: 7.069 ft^2
Maximum Soil Pressure: 0.618.62 ksf

Applied Loads

Lateral Concentrated Load (k)		Lateral Distributed Loads (k/ft)		Vertical Load (k)
D : Dead Load	k	k/ft		0.6420 k
Lr : Roof Live	k	k/ft		k
L : Live	k	k/ft		k
S : Snow	k	k/ft		k
W : Wind	0.9770 k	k/ft		k
E : Earthquake	k	k/ft		k
H : Lateral Earth	k	k/ft		k
Load distance above ground surface	16.708 ft	TOP of Load above ground surface	ft	
		BOTTOM of Load above ground surface	ft	

Load Combination Results

	Forces @ Ground Surface		Required	Pressure at 1/3 Depth		Soil Increase
Load Combination	Loads - (k)	Moments - (ft-k)	Depth - (ft)	Actual - (psf)	Allow - (psf)	Factor
+D+W	0.977	15.728	6.63	433.4	433.5	1.000

Concrete Caisson

DESCRIPTION: Design Concrete Caisson

Code References

Calculations per ACI 318-14, IBC 2018, CBC 2019, ASCE 7-16
Load Combinations Used : ASCE 7-16

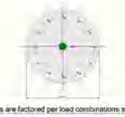
General Information

f'c : Concrete 28 day strength = 3.250 ksi
E = 3,122.0 ksi
Density = 150.0 pcf
= 0.850
fy - Main Rebar = 60.0 ksi
E - Main Rebar = 29,000.0 ksi
Allow. Reinforcing Limits: ASTM A615 Bars Used
Min. Reinf. = 0.250 %
Max. Reinf. = 8.0 %

Overall Caisson Height: 7.0 ft
End Fixity: Top Free, Bottom Fixed
Brace condition for deflection (buckling) along Caisson :
X-X (width) axis :
Fully braced against buckling ABOUT Y-Y Axis
Y-Y (depth) axis
Fully braced against buckling ABOUT X-X Axis

Caisson Cross Section

Column Dimensions: 36 0in Diameter, Caisson Edge to Rebar Edge Cover = 3.0in
Column Reinforcing: 12 - #5 bars



Entered loads are factored per load combinations specified by user.

Applied Loads

Caisson self weight included: 7,422.01 lbs * Dead Load Factor
AXIAL LOADS...
Reaction from Pole: Axial Load at 7.0 ft above base, D = 0.7320 k
BENDING LOADS...
Reaction from Pole: Lat. Point Load at 7.0 ft creating Mx-x, W = 1,628 ft-k
Reaction from Pole: Moment acting about X-X axis at 7.0 ft, W = 26,213 k-ft

DESIGN SUMMARY

Load Combination: +0.90D+W+1.60H
Location of max above base: 6.953 ft
Maximum Stress Ratio: 0.672 : 1
Ratio = (Pu^2+Mu^2)^.5 / (PhiPn^2+PhiMn^2)^.5
Pu = 7.357 k, φ * Pn = 98.643 k
Mu-x = 26.137 k-ft, φ * Mn x = -369.236 k-ft
Mu-y = 0.0 k-ft, φ * Mn-y = 0.0 k-ft
Mu Angle = 0.0 deg
Mu at Angle = 26.137 k-ft, φMn at Angle = 363.063 k-ft
Pn & Mn values located at Pu-Mu vector intersection with capacity curve

Caisson Capacities . . .

Pmax : Nominal Max. Compressive Axial Capacity: 3,024.81 k
Pmin : Nominal Min. Tension Axial Capacity: k
φ Pn, max : Usable Compressive Axial Capacity: 1,799.78 k
φ Pn, min : Usable Tension Axial Capacity: k

Maximum SERVICE Load Reactions . .

Top along Y-Y: 0.0 k, Bottom along Y-Y: 0.0 k
Top along X-X: 0.0 k, Bottom along X-X: 0.9770 k

Maximum SERVICE Load Deflections . . .

Along Y-Y: 0.000339 in @ 7.0 ft above base for load combination : W Only
Along X-X: 0.0 in @ 0.0 ft above base for load combination :

General Section Information . φ = 0.76, β = 0.650, ρ = 0.865
ρ % Reinforcing: 0.3655 %, Rebar % Ok
Reinforcing Area: 3.720 in^2
Concrete Area: 1,017.88 in^2
